

1. Solve the following formula for t.

$$M = Q(1 + rt)$$

The solution is $t = \boxed{}$. (Simplify your answer.)

2. Solve $3A - 4B = 93$ for A.

$$A = \boxed{}$$

(Simplify your answer. Use integers or fractions for any numbers in the expression.)

3. Solve for y and graph the equation with a standard window on a graphing utility.

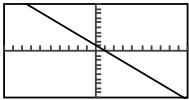

$$7x - 6y = 7$$

$$y = \boxed{}$$

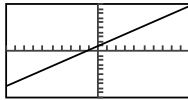

(Simplify your answer. Use integers or fractions for any numbers in the expression.)

Use a graphing calculator to graph the equation with a standard window. Choose the correct graph below.

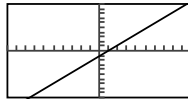

☐ A.

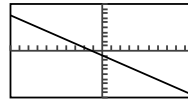

☐ B.

☐ C.

☐ D.

4. As part of a damage award in a jury trial, a penalty handed down included a \$46 billion judgment against a company. If this amount was 92% of this company's revenue last year, how much was the company's revenue last year?

The company's revenue last year was \$ billion.

(Simplify your answer.)

5. The total cost of a new automobile, including a 9% sales tax on the price of the automobile, is \$27,062. How much of the total cost of this new automobile is sales tax?

The sales tax is \$

(Round to the nearest dollar as needed.)

6. The total cost of a new automobile priced at \$25,242, including sales tax is \$26,756. Find the sales tax to the nearest percent.

The sales tax rate is %

- *7. After Mrs. Fisher lost 17% of her investment, she had \$14,525. What was Mrs. Fisher's original investment?

The original value of the investment was \$.
